

Academic excellence for business and the professions

8th International Conference on Compressors and Refrigeration, Xi'an, China, 20-22/07/2017 **KEYNOTE**

Modelling of Multiphase Twin Screw Machines

Professor Ahmed Kovacevic

Howden Chair in Engineering Design and Compressor Technology

Centre for Compressor Technology Department of Mechanical Engineering and Aeronautics

www.city.ac.uk

18,000 students - 46% at postgraduate level from more than 150 countries

1894 - Northampton Polytechnic Institute 1966 - University created by Royal Charter

2016 - City joins the University of London

5 Schools: Business, SMCSE, Arts and Social Sciences, Law, Health Sciences Graduate School; Research Centres; Interdisciplinary Centres

School of Mathematics, Computer Science and Engineering Department of Mechanical and Aeronautical Engineering Centre for Compressor Technology

Centre for Compressor Technology

- Established in 1995 to assist UK compressor industry
- Consultancy to over 100 organisations in 30 countries
- Books, Journal and Conference Publications, Patents, Awards
- Spin off and Start-up, licenseing rotor profile and software

Main activities

- Research in Screw Compressors and Expander; rotor profiling; modelling; multiphase flows; CFD, computational and experimental methods
- Design, Testing, Development with industry

Agenda

Introduction

- 3D Modelling of multiphase screw machines
- Recent developments in grid generation for CFD in multiphase screw machines

Test cases

Thank you to: EPSRC, Trane, UTRC, Goodrich, Howden, Kobelco, PDM Analysis Ltd, Simerics, Star-CCM+, CFX Berlin, VertRotors, for support in development of SCORG and CFD in PD screw machines.

Screw Compressors Today

83% Oil injected ; 17% Oil free

- Applications: Industrial and commercial Air compression, Refrigeration, Process gasses Oil & Gas, Expanders, multiphase
- Dia (35) 50 1000 mm
- 0.3 >1000 m³/min
- 0.5 kW 5 MW
- High Efficiency, Reliable

~ 11 million screw compressors produced to date

Bear shaft screw compressors
commissioned in 2016 (est.):Refrigeration:166,000Oil and Gas:24,000Petrochemical:25,000Air (est.)>500,000

Large Packages ~800

80% of new industrial compressors are screw compressors La 17% energy produced in developed countries used for compression 25% energy in USA during summer is used for refrigeration and air-conditioning

Global screw compressor sales \$7.99 billion in 2016

Screw Compressor Market, by Region, 2021 (USD Billion)

Source: MarketsandMarkets Analysis

The oil-free segment is expected to grow at the highest CAGR from 2016 to 2021

Compressors and energy

- Compressors consume more than 17% energy produced in developed countries. This pollutes the environment with more than 3000 MtCO₂ per year, while energy costs exceed €275 billion per year*.
- The global CO_2 emission will increase by up 28% from 2015 to 2030,
- The latest EU targets for 2020 are to reduce the CO₂ emissions by 20% from the levels recorded in 1990. This requires:
 - 20% of energy produced by renewable sources
 - increase energy efficiency by 20% from the levels recorded in 2007.

currently these targets may not be achieved despite efforts by both industry and academia.

Oil injected compressors and other multiphase fluid handling machines have great potential for improvements in efficiency and contributing to reduction in CO₂ emission.

Introduction

- Purpose of oil Injection
 - Cooling of the gas during compression
 - Sealing of the leakage gaps
 - Lubrication of rotors in contact
- Factors that affect efficiency:
 - Viscous friction power loss, oil drag and momentum loss
 - Optimum quantity and timing of oil injection
 - Oil injection temperature and residence time inside the compression chamber
 - Spray formation, droplet diameter and spread,
 - Impingement on the rotors and casing effect the usability of injected oil.

Challenges:

- It is almost impossible to gain optical visualization inside the compression chambers.
- Limitations of currently used experimental and analytical methods

Oil Power Loss Contributions in Leakages

(Deipenwisch and Kauder, 1999)

Modelling of Multiphase Flow

- Characterization of multiphase flow regimes based on the various coupling effects between the continuous and the dispersed phases
- Eulerian Lagrangian
 - dispersed phase is very low and the phase particles are very fine with negligible momentum
 - compressed gas is treated as the continuous phase and oil droplets as particles in the Lagrangian frame
 - one way, two way and turbulence couplings possible
- Eulerian Eulerian
 - condition of heavily oil flooded operation
 - in addition to the oil droplets, oil film on the rotor and housing will occur
 - the pressure field solution is shared by the two phases and the independent momentum equations calculate relative slip and shear between the gas and oil

Mathematical models for calculation of multiphase positive displacement screw machines

1) Analytical methods

pVⁿ=const - analytical calculation of "n" simple model, very inaccurate

- 2) <u>Differential methods</u> (based on conservation principles)
 - A. Thermodynamic chamber model increased complexity, many assumptions, better accuracy
 - B. 3D Computational Fluid Dynamics (CFD) model complexity significantly increased, very few assumptions are made
 - C. Integrated model not as complex as 3D but more accurate than Chamber model

General conservation equation – differential methods

Oil Injected Screw Compressor Modelling

Thermodynamic Chamber Model

Dilute Oil Flow

Oil droplets are assumed to be spherical of a constant mean Sauter diameter. Balance of the heats exchanged between the spherical droplets and the gas is used for calculating temperature

Mass, Momentum, Energy and Space conservation in 3D CFD

 \underline{v}_b is the velocity of the control volume edge $\frac{\partial}{\partial t} \int_{V} \rho \, dV + \int_{S} \rho \, (\vec{v} - \vec{v}_b) . \vec{n} \, dS = 0$ $\frac{\partial}{\partial t} \int_{\mathcal{O}} \rho \vec{v} dV + \int_{\mathcal{O}} \rho \vec{v} (\vec{v} - \vec{v}_{b}) . \vec{n} dS = \int_{\mathcal{O}} \rho \vec{f} dV + \int_{\mathcal{O}} \vec{T} dS$ $\rho, p, E = \text{cst}, \vec{v} = 0$ $\partial t = \int_{\Omega} \vec{v}_b \cdot \vec{n} \, dS$ $\frac{\partial}{\partial t} \int_{\mathcal{X}} \rho E dV + \int_{S} \rho E (\vec{v} - \vec{v}_{b}) \cdot \vec{n} dS = \int_{V} \rho \vec{f} \cdot \vec{v} dV + \int_{S} \vec{n} \cdot \vec{\sigma} \cdot \vec{v} dS - \int_{S} \vec{q} \cdot \vec{n} dS$ Space conservation law Control volumes must exist in time

Connectivity must be kept fixed during timestep

from J. Vierendeels, Ghent University, Introduction to CFD in PD machines, Short Course, London, Sep 2015

Modelling of Oil Injected Screw Machines

Eulerian treatment of the compressed gas and the injected oil

- a) Full Euler-Euler
 - Pressure field shared between the phases
 - Independent u,v,w momentum conservation equation for each phase with • interphase drag effects
 - Mass conservation between phases in case of phase change.
 - Independent energy conservation equation with interphase heat transfer
 - Homogeneous or Phase specific turbulence model •
- Volume of Fluid suitable for dense stratified flows a)
 - Pressure field shared between the phases
 - One additional momentum conservation equation for liquid phase
- b) Simplified Euler approach for fluids with no slip conditions
 - Pressure field shared between the phases
 - Additional concentration equation with special modelling of source terms

Solution algorithm

Remeshing

Prerequisite for reliable 3D CFD

Analytical grid generation with differential smoothing Sliding and stretching interface between rotor subdomains

Analytical grid generation with differential smoothing Stretching non-conformal interface between rotor subdomains

Analytical grid generation with differential smoothing Single domain of two rotors with no interface

Application of different grid types

Rotor to Casing Non-Conformal

- Two rotor domains with sliding interface
- Machines with multiple gate rotors
- Rotors with straight and helical lobes
- Accurate mapping of rotor profile
- Grid adaptation
 possible
- Suitable for single phase calculation

Casing to Rotor Non-Conformal

- Two rotor domains with stretching interface
- Machines with multiple gate rotors
- Rotors with straight and helical lobes
- Suitable for large wrap angles (vacuum pumps)
- Suitable for VOF multiphase calculations

Casing to Rotor Conformal

- Single Domain for both rotors – no interface
- Rotors with straight and helical lobes
- Most suitable for multiphase flows
- Stable for Euler-Euler multiphase calculation
- Any commercial CFD solver

Results – Oil distribution

Solver Residual Levels

				RMS Res	sidual at id	lentical tim	e step			
rpm			3000					6000		
	Momentum	Energy	Turbulent kinetic energy	Volume fraction	Courant Number	Momentum	Energy	Turbulent kinetic energy	Volume fraction	Courant Number
Case 1	6.8E-04	3.4E-03	6.1E-04	2.1E-04	9.60	1.8E-03	1.7E-03	1.0E-03	2.9E-04	6.33
Case 2	5.8E-04	1.8E-03	1.0E-03	2.1E-04	9.20	5.8E-04	1.1E-03	9.0E-04	2.5E-04	5.69
Case 3	8.2E-04	1.9E-03	1.2E-03	2.3E-04	8.50	6.9E-04	1.2E-03	1.3E-03	2.6E-04	5.55

- Data is collected at the final co-efficient loop iteration of converged time step corresponding to identical rotor position
- RMS residuals with the Differential Grid of Case 2 are better in comparison to Algebraic Grid in Case 1
- Lower Courant numbers in Cases 2 and 3 at both rotor speeds indicate better stability of the solver

Conjugate heat transfer using SCORG and Ansys-CFX

Comparison of temperature profile on the rotor center lines

- Temperature in the internal surface calculated from transient CFD analysis mapped into the model.
- Plot temperature along the centre line of the two rotors
- From gas temperature 300K at suction end to gas temperature 340K at discharge, uniform rise is noticed along the rotors.
- Reduction I temperature on shaft ends due cooling by oil
- Uniform temperature in rotor cross sections

ANSYS CFX - Post

Temperature distribution in the Casing Body – Exterior

 Rotors inside have higher temperature than the housing Highest housing temperature at discharge port subjected to gas exit Temperature.

- More uniform temperature distribution across the width than along the length.
- Housing centre under high thermal gradients.

 Local temperature variation suggests that temperature distribution is not uniform regardless it is uniform on the rotors.

ANSYS CFX - Post

Temperature distribution in the Casing Body – Interior

- High temperature zone with high gradients at discharge end conducting directly to the colder suction side
- Housing temperature is higher at the female rotor side than at the male side because of lower conduction.

Conclusions

- CFD in screw machines is today readily available to be used fro modelling of <u>multiphase screw machines.</u>
- The key element required for successful CFD of these machines is <u>availability a good numerical mesh.</u>
- <u>SCORGTM</u> is unique grid generator which allows fast and reliable multiphase CFD with Pumplinx, Ansys-CFX, Star-CCM+ and Fluent
- Integrated with chamber modelling, SCORGTM enables full accurate and reliable analysis and improved performance of screw machines which contributes to reduction of carbon footprint.

Modelling of Multiphase Screw Machines *Professor Ahmed Kovacevic a.kovacevic@city.ac.uk , www.city.ac.uk/centre-compressor-technology*

11th - 13th September 2017

10th International conference on compressors and their systems. In conjunction with the Institution of Mechanical Engineers.

10th International Conference on Compressors and their Systems

HOERBIGER Reception sponsor

Days 1 and 2

Research and technical papers including keynotes, podium papers and discussions.

Industry Day (Day 3)

<u>Representatives from industry</u> discuss challenges and success in technology or market demands, eg. due to economic, environmental or legislative changes.

The 3rd Short Course on CFD in Rotary Positive Displacement Machines 9th-10th September 2017

- 1. Accurate prediction and sensitivity of clearance size variation during operation on the leakage flow through the machines.
- 2. Use of CFD tools to predict variation in gap size.
- 3. Stability and accuracy of Multiphase flow calculations in 3D simulations of compressors.
